

Explain Water Cycle Processes: Practice Independently

Name: _____ Date: _____

Use the material to work through each task. Show the requested response.

A simplified water cycle

Liquid water can evaporate into water vapor. Cooling vapor can condense into droplets. Water in clouds can fall as precipitation. Water may collect, flow or soak into the ground. Water takes many paths, so this short sequence is a simplified model.

1. Name two forms of precipitation.

2. After reaching land, name one path water can take.
