

Explain Water Cycle Processes: Explore and Explain

Name: _____ Date: _____

Explore the material. Talk through your reasoning with suitable support.

A simplified water cycle

Liquid water can evaporate into water vapor. Cooling vapor can condense into droplets. Water in clouds can fall as precipitation. Water may collect, flow or soak into the ground. Water takes many paths, so this short sequence is a simplified model.

1. Which process changes liquid water into vapor?

2. Which process forms droplets from water vapor?
